

AI ASSIGNMENT — Knowledge Representation, Reasoning and Planning
 Saumil Lakra, 2021097

THEORY

	$G: \text{green light} \leftarrow (S_1 \wedge S_2 \wedge S_3)$ $Y: \text{yellow light}$ $R: \text{red light} \leftarrow (S_1 \wedge S_2 \wedge S_3)$
	Condition 1: $\leftarrow (S_1 \wedge S_2 \wedge S_3)$ $(G \vee Y \vee R) \wedge \neg(G \wedge Y) \wedge \neg(G \wedge R) \wedge \neg(Y \wedge R)$
	Condition 2: $S_i: \text{traffic light state at initially}$ $S_{i+1}: \text{traffic light state off after 1 cycle}$ $G_{S_i} \wedge \neg G_{S_{i+1}} \rightarrow Y_{S_{i+1}}$ At state S_i , green light is there. At state S_{i+1} , green light goes off & Y is switched on.
	Similarly for rest of the lights.
	$Y_{S_i} \wedge \neg Y_{S_{i+1}} \rightarrow R_{S_{i+1}}$ $R_{S_i} \wedge \neg R_{S_{i+1}} \rightarrow G_{S_{i+1}}$ $\Rightarrow a \wedge b \wedge c$ $\neg(a \wedge b \wedge c) \leftarrow ((S_1 = N) \wedge (S_2 = N) \wedge (S_3 = N))$ In other case when answer (b, a, c) wrong

Condition 3

S. J. TANNADEKA IA

After 3 cycles, the colour of light goes off.

$$(G_{s_i} \wedge G_{s_{i+2}} \wedge G_{s_{i+4}}) \rightarrow \neg G_{s_{i+3}} \text{ (a)} \quad \text{S. J. TANNADEKA IA}$$

$$(Y_{s_i} \wedge Y_{s_{i+2}} \wedge Y_{s_{i+4}}) \rightarrow \neg Y_{s_{i+3}} \text{ (b)}$$

$$(R_{s_i} \wedge R_{s_{i+2}} \wedge R_{s_{i+4}}) \rightarrow \neg R_{s_{i+3}} \text{ (c)}$$

$$(a \wedge b \wedge c) \rightarrow \neg (a \wedge b \wedge c)$$

$$\Rightarrow a \wedge b \wedge c \quad \text{S. J. TANNADEKA IA}$$

Illustrating to state trial effort : 32

2nd & 3rd state trial effort : 32

2. C, color palette : {c₁, c₂, ..., c_n}

N: set of nodes

R: set of edges

1. 2 connected (adjacent) nodes don't have same color. (AXIOM 1)

$$\forall n_1, n_2 \in N, \text{Edge}(n_1, n_2) \rightarrow \forall c \in C, \neg (\text{color}(n_1, c) \wedge \text{color}(n_2, c))$$

2. Exactly 2 nodes are allowed to wear yellow. (AXIOM 2)

$$(\exists n_1, n_2 \in N, \text{color}(n_1, y) \wedge \text{color}(n_2, y) \wedge n_1 \neq n_2) \wedge$$

$$\forall n \in N, (n = n_1 \wedge n \neq n_2) \rightarrow \neg (\text{color}(n, y))$$

y: yellow

color(n, d) means node n has color d.

3. Starting from any red node, you can reach a green node in no more than 4 steps. (AXIOM 3)

~~starting colors not needed~~

$\text{route}(e_1, e_2, s) : \text{Route from } \& \text{ node } e_1 \text{ to } e_2$
~~with } s \text{ or less no: of steps.~~

~~but min + (t) 9~~

$$\forall n \in N \ \text{color}(n, R) \rightarrow (\exists n_2 \in N \ \text{color}(n_2, G) \wedge \text{route}(n, n_2, 4))$$

$\downarrow \leftarrow 9 \quad \leftarrow 19$

R: red color

G: green color

4. For every color in the palette, there is at least one node with this color. (AXIOM 4)

~~starting colors not needed~~

$$\forall t \in C \ \exists n \in N \ \text{color}(n, t)$$

$\leftarrow 1 \leftarrow 19 \leftarrow 107$

5. The nodes are divided into exactly $|C|$ disjoint non-empty cliques. (AXIOM 5)

~~Any 2 nodes of same color, they must be connected~~

$$\forall n_1, n_2 \in N, \forall c \in C \ (\text{color}(n_1, c) \wedge \text{color}(n_2, c) \wedge n_1 \neq n_2) \rightarrow$$

~~Edge(n_1, n_2)~~

$$((c) \cap (c)) \neq \emptyset \leftarrow 107 \quad \cancel{\text{Edge}(n_1, n_2)}$$

$$\forall n_1, n_2 \in N, \forall t \in C \ (\text{color}(n_1, t) \wedge \text{color}(n_2, t) \wedge n_1 \neq n_2) \rightarrow$$

$$(\text{Edge}(n_1, n_2) \wedge \text{Edge}(n_2, n_1))$$

3

Show that a dog can read shows him good reading skills. &
 $\forall t \in M(tXt)$ reads \rightarrow not smart at it.

Whoever can read is literate.

$\exists t \in M$ about a reading book : $(t, \text{dog}, \text{book})$ shows

update to : ~~Refrigerator~~ ~~same~~ after

$R(t)$: t can read

$(\exists t \in M)L(t)$: t is literate \rightarrow not smart

$(\forall t \in M)R(t)$

$PL \Rightarrow R \rightarrow L$

$FOL \Rightarrow \forall t (R(t) \rightarrow L(t))$

reflexive reading : \sim

Dolphins unfortunately are not literate

so $\exists t \in M(t \neq \text{dolphin} \wedge t \text{ reads book})$ does not \models

$D(t)$: t is dolphin with whom shows

$L(t)$: t is literate.

$PL \Rightarrow D \rightarrow (\neg L)$ not reading \models

$FOL \Rightarrow \forall t (D(t) \rightarrow \neg L(t))$

Therefore $\exists t$ (pt. x) who behaves and is not \models

Some dolphins are intelligent \models before man

but now we \models from above parts $D(t)$ & is used.

$I(t)$: t is intelligent

\leftarrow fact. $\forall x (D(x) \wedge I(x)) \models$

$PL \Rightarrow D \wedge I$

$FOL \Rightarrow \exists x (D(x) \wedge I(x))$

$\wedge (\exists x_1) \text{ reads } \wedge (\exists x_2) \text{ reads } \rightarrow \neg \exists x_1 \text{ reads } \models$

$((\exists x_1) \text{ reads } \wedge (\exists x_2) \text{ reads }) \leftarrow$

Some who are intelligent cannot read.

$I(t) \wedge R(t)$ from above questions.

$$PL \Rightarrow I \wedge \neg R$$

$$FOL \Rightarrow \exists t (I(t) \wedge \neg R(t))$$

There exists a dolphin who is both intelligent & can read
but for every intelligent dolphin, if it can read, it
must be that it is not literate.

Predicates used here from above questions.

$$PL \Rightarrow (D \wedge I \wedge R) \wedge \forall x ((Dx) \wedge I(x) \wedge R(x)) \rightarrow \neg L(x)$$

$$PL \Rightarrow (D \wedge I \wedge R) \wedge \forall x ((Dx) \wedge I(x) \wedge R(x)) \rightarrow \neg L(x)$$

FOL $\Rightarrow \exists t$

$$FOL \Rightarrow \exists t (D(t) \wedge I(t) \wedge R(t)) \wedge \forall x ((Dx) \wedge I(x) \wedge R(x) \rightarrow \neg L(x))$$

$$\neg R \vdash \neg I$$

$$\neg I \vdash \neg R$$

$$I \vdash \neg R$$

$$\neg I \vdash$$

Re Resolution of 4th statement no after min?

PL \Rightarrow disjunctive normal form CNF & (F) T

$$R \rightarrow L \Rightarrow \neg R \vee L$$

$$D \rightarrow \neg L \Rightarrow \neg D \vee \neg L \wedge \neg T \Leftarrow 19$$

$$D \wedge I \wedge \neg R \wedge \neg (F) \wedge E \Leftarrow 107$$

~~I~~

Let us do resolution step by step (1) substitute a stack with

To prove, $I \wedge \neg R$ is true in given min and standard, now it is left to prove

We take its we negate it.

$$\neg(I \wedge \neg R) \Leftrightarrow \neg I \vee R$$

$$= \neg I \vee R$$

$$(x) I \rightarrow S = ((x) R \wedge (x) \neg I \wedge (x) \neg R) \wedge \neg I \wedge (x) \neg R \Leftarrow 19$$

Available set of clauses:

$$(x) R \rightarrow ((x) R \wedge (x) \neg I \wedge (x) \neg R) \wedge \neg I \wedge (x) \neg R \Leftarrow 19$$

& $\{(\neg R \vee L), (\neg D \vee \neg L), (D), (I)\}$

(Resolution) $\neg I \wedge ((x) R \wedge (x) \neg I \wedge (x) \neg R) \wedge \neg I \wedge (x) \neg R \Leftarrow 107$

$\neg I \wedge$

$\neg I \vee R$

$\neg R \vee L$

\backslash

$\neg I \vee L$

\backslash

$\neg D \vee \neg L$

\backslash

$\neg I$

\backslash
empty
clause

This confirms our contradiction, implying (1) has
~~to false~~

Resolution of 5th statement

$$(D \wedge I \wedge R) \wedge \forall x((D(x) \wedge I(x) \wedge R(x)) \rightarrow \neg L(x))$$

negation of above statement.

$$(\neg D \vee \neg I \vee \neg R) \vee \exists x(D(x) \wedge I(x) \wedge R(x) \wedge L(x))$$

in this we can see that there exists someone
who ~~is~~ can read but is not literate, this
contradicts $R \rightarrow L$ (statement 1)

This confirms our contradiction.

COMPUTATIONAL

2. Reasoning:

- **Brute-Force Approach:**

Memory used for direct_route_brute_force: 0.03125 MiB

Time taken for direct_route_brute_force: 0.6642169952392578 seconds

Steps taken for direct_route_brute_force: 4804

Test direct_route_brute_force (2001, 2005): Pass

- **FOL Library-Based Reasoning:**

Memory used for query_direct_routes: 0.0002 MiB

Time taken for query_direct_routes: 0.6582179069519043 seconds

Steps taken for query_direct_routes: 4

Test query_direct_routes (2001, 2005): Pass

Brute force approach is less efficient since it has $O(n)$ complexity and requires 4804 steps to reach the solution. For this particular test case, their time taken is approximately equal, brute force approach taking more time than FOL pydatalog approach. Brute force uses more memory as compared to FOL method because it relies on dictionary structures instead of linear search($O(n)$), incase of brute force.

3. Planning:

- **Forward Chaining:**

Memory used for forward_chaining: 0.015625 MiB

Time taken for forward_chaining: 0.6186718940734863 seconds

Steps taken for forward_chaining: 4

Test forward_chaining (22540, 2573, 4686, 1): Pass

- **Backward Chaining:**

Memory used for backward_chaining: 0.0625 MiB

Time taken for backward_chaining: 0.6909177303314209 seconds

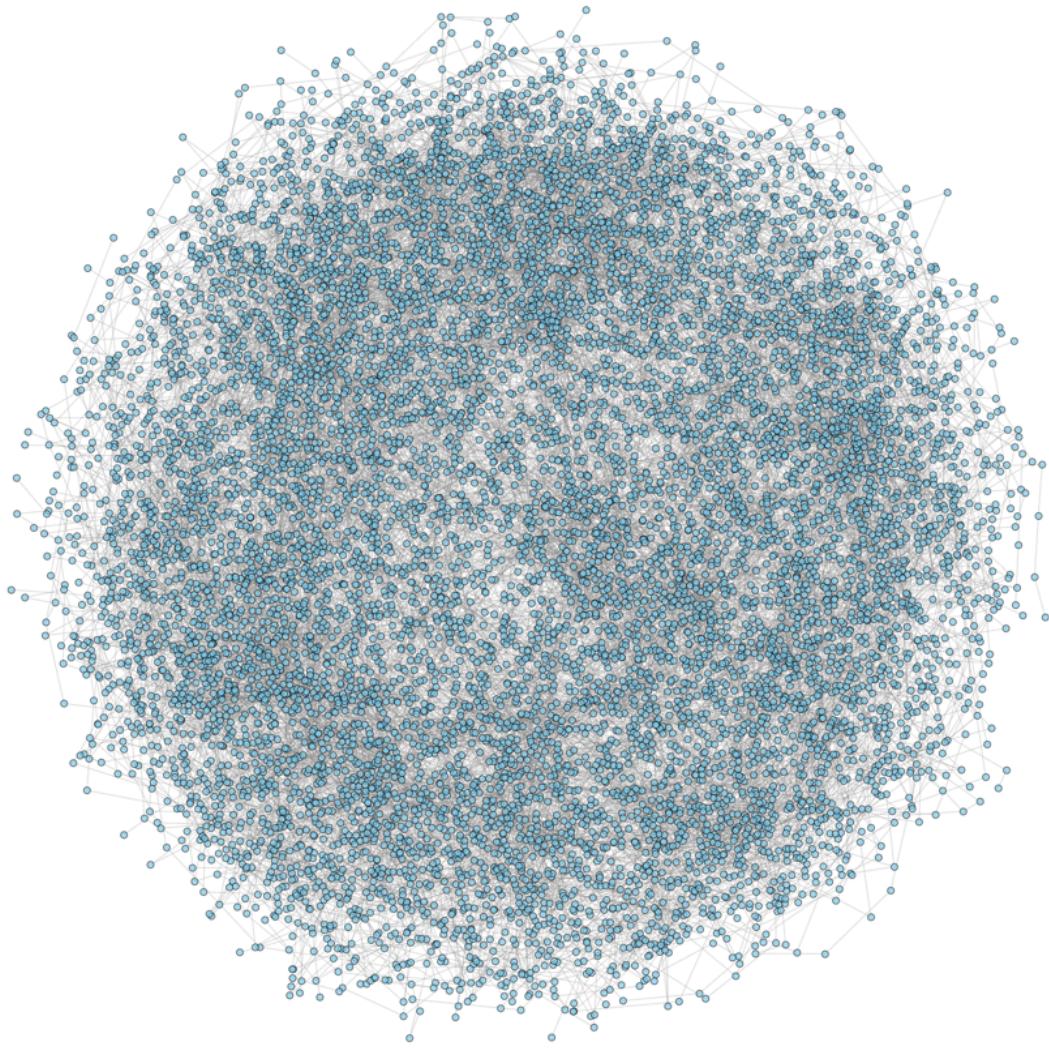

Steps taken for backward_chaining: 2

Test backward_chaining (22540, 2573, 4686, 1): Pass

Both the methods take approximately equal time, with backward chaining taking more time than forward chaining. Both of the methods are memory efficient with backward chaining taking slightly more memory than forward chaining, this is because intermediate caching is used for goal based querying. In terms of steps taken backward chaining is more efficient.

In all the above methods, to get non zero memory a dummy is being used.

Graph Representation of route_to_stops mapping using Plotly

Here,

- Stops are nodes
- Routes are the edges

High resolution png is attached with the assignment
